

Minimax Values

States Under Agent's Control:

$$V(s) = \max_{s' \in \text{successors}(s)} V(s')$$

States Under Opponent's Control:

$$V(s') = \min_{s \in \text{successors}(s')} V(s)$$

Terminal States:

$$V(s) = \text{known}$$

Tic-Tac-Toe Game Tree

Adversarial Search (Minimax)

- Deterministic, zero-sum games:
 - Tic-tac-toe, chess, checkers
 - One player maximizes result
 - The other minimizes result
- Minimax search:
 - A state-space search tree
 - Players alternate turns
 - Compute each node's **minimax value**: the best achievable utility against a rational (optimal) adversary

Minimax Implementation

```
def value(state):
```

if the state is a terminal state: return the state's utility

if the next agent is **MAX**: return **max-value(state)**

if the next agent is **MIN**: return **min-value(state)**

```
def max-value(state):
```

initialize $v = -\infty$

for each successor of state:

$v = \max(v, \text{value(successor)})$

return v

```
def min-value(state):
```

initialize $v = +\infty$

for each successor of state:

$v = \min(v, \text{value(successor)})$

return v
