## Optimal Quantities

- The value (utility) of a state s:
- $V^*(s) =$ expected utility starting in s and acting optimally
- The value (utility) of a q-state (s,a):  $Q^*(s,a) =$ expected utility starting
  - out having taken action a from state s and (thereafter) acting optimally
- The optimal policy:
- $\pi^*(s) = \text{optimal action from state s}$

s is a state (s, a) is q-state (s,a,s') is a transition
